Abstract

This qualitative review aims to synthesize the evidence on nurses' experience of intervening with fathers when providing care to their young children. Five databases were searched. Inclusion criteria were (a) nurses' experience, (b) intervention with fathers, (c) written in English or French. Data were extracted by two independent reviewers. Qualitative thematic synthesis of 17 peer-reviewed studies was performed by 12 family nurse researchers from six countries. Three analytical themes were identified: "Conceiving of the father's role in terms of his involvement within the family"; "Working with fathers based on the nurse's individual conception of the paternal role"; and "Developing a sense of efficacy in working with fathers." The results highlight the importance of raising family nurses' awareness of fathers' individual realities. Training in this regard makes it possible to modify nurses' perceptions of the paternal role and to promote the adoption of father inclusive practices within the family.

Keywords

nurse attitudes, belief, self-efficacy, fathers, childcare

Introduction

The evolving landscape of family models in the West over the past three decades reflects a dynamic response to changing societal norms (Volling & Palkovitz, 2021). In response to new family realities, the father's role has also evolved, and men are showing a desire to become involved early in their children's lives (Gervais et al., 2021). Extensive research has documented the multifaceted positive effects of paternal involvement on various aspects of family well-being (Watkins et al., 2024). Fathers' involvement has a beneficial and lasting influence on children's social-emotional (Howard et al., 2006), cognitive (Howard et al., 2006), and academic development (McBride et al., 2005), as well as on the mental health of mothers (de Montigny, Gervais, Pierce, & Lavigne,

2020) and fathers themselves (Kotila & Kamp Dush, 2013), and the marital relationship (Fagan & Cabrera, 2012). These positive impacts underscore the importance of involved fatherhood in shaping the overall family well-being.

The perinatal period is a critical time for a father's involvement with his child. The level of paternal involvement during pregnancy is a reliable predictor of postnatal paternal involvement (Lamb, 2010; Ramchandani et al., 2013). However, although fathers want to be involved and support their partners throughout pregnancy, many feel ill-equipped to do so and encounter barriers related to the organization of health services (de Montigny et al., 2016). As such, a significant number of fathers report difficulty not only in navigating services, but also in obtaining support and guidance from health professionals (Da Costa et al., 2015; de

Montigny et al., 2013). Health professionals play an important role with fathers, and their support can positively influence fathers' involvement with their child (Holtslander, 2005). Beliefs and perceptions regarding fathers play a determinant role in how health professionals engage and interact with fathers (de Montigny & Lacharité, 2012). The more positively professionals view fathers, the more they will involve fathers in the child's care and the more effective they will feel during interactions (de Montigny et al., 2017; de Montigny, Gervais, Larivière-Bastien, & Dubeau, 2020). Despite the fact that professionals are increasingly recognizing the importance of including fathers in their practice (Alehagen et al., 2011), some are still reluctant to involve them and sometimes feel ill-equipped to interact with them (Höglund & Holmström, 2008). In this context, Dubeau et al. (2023) sought to analyze practices in the health and social services network that support paternal involvement in Quebec, Canada. The results of this research provided a portrait of father-inclusive practices, but the voice of nurses was not well represented (Dubeau et al., 2023). Since nurses play a major role with young families, and how they intervene can have a significant impact on early paternal involvement, there is a need to explore nurses' perceptions of their practice and interactions with fathers. Although some studies have examined the benefits of adopting father-inclusive nursing practices, the experience of these professionals when working with fathers remains unclear. A better understanding of nurses' experiences is needed to improve the support offered to men in health services.

Thus, the purpose of this review is to systematically synthesize the qualitative evidence on nurses' experience of interacting with fathers when providing care to their children and adolescents. This review is based on two research questions:

Research Question 1: What attitudes and beliefs do nurses hold regarding fathers of children and adolescents?

Research Question 2: What are nurses' sense of efficacy in collaborating with them?

To acknowledge the unique roles of fathers, this review specifically centers on the term "fathers" rather than referring to parenting partners.

Method

The approach chosen to develop this qualitative systematic review is the thematic synthesis of Thomas and Harden (2008). This method allows for a new interpretation of the data and the emergence of new knowledge that goes beyond the findings of previous studies. The *Enhancing Transparency in Reporting the Synthesis of Qualitative Research* (ENTREQ) guidelines were used to report this qualitative synthesis (Tong et al., 2012).

Search Methods

The modified population, context, outcomes (PCO) framework for qualitative methodology was used to formulate the research questions and select keywords (Butler et al., 2016). The literature search was conducted by two reviewers independently (C.R. and I.L.) in five databases (CINAHL, MEDLINE, PsycInfo, Scopus, ScienceDirect) between October and December 2020, and with an update in September 2024. The respective thesauri of the databases enabled the validation of the choice of keywords. The Boolean operators "OR" and "AND" and word truncation were used to distinguish synonyms, combine terms, and capture all possible spellings and endings (Aromataris & Riitano, 2014; Butler et al., 2016). The search was limited to studies published since 2000, as research interest in this phenomenon began during that time. No limitation was placed on country of origin. The bibliographic references of the selected articles were reviewed to identify additional relevant studies

missed in the electronic search. Table 1 presents the literature search strategy for the different databases.

Inclusion and/or Exclusion Criteria

To be included in this thematic synthesis, the selected studies met five criteria: (a) a sample consisting wholly or partly of nurses whose perspectives could be distinguished from those of other participants; (b) results addressing nurses' experiences with fathers of children and adolescents either hospitalized or receiving care and services in the community; (c) a primary study that used any type of qualitative method of data collection and analysis; mixed-method studies were excluded only if the quantitative results were predominant; (d) published in English or French, as these were the languages in which the reviewers were proficient; and (e) peer-reviewed and included an abstract. Gray literature was not explored in the selection process.

Search Outcome

The *Preferred Reporting Items for Systematic Reviews and Meta-Analyses* (PRISMA) diagram was used to report the different stages of the study selection process; see Figure 1 (Page et al., 2021). To counteract judgment bias that can occur when there is only one reviewer, the reviewers used inter-judge agreement for all study selection steps (C.R., I.L.) (Butler et al., 2016). In total, the literature search identified 1,548 studies, which were imported into Endnote X20 software. After removing duplicates, 1,055 studies

were initially screened based on title, abstract, and inclusion criteria. From this review, 44 publications were retained and read in full by the reviewers (C.R.; I.L.). Disagreements about the eligibility of an article were resolved by input from a third reviewer (F.D.), an expert in the field. As a result of this step, a total of 27 articles were excluded, either because they did not address the phenomenon of interest (20), were ineligible publication types (5), or used quantitative methodology or secondary data analysis (2). At the end of the selection process, 17 original articles were selected for the thematic synthesis. All selected articles were in English, and no articles were added after manual verification of bibliographic lists.

Quality Appraisal

The *Critical Appraisal Skills Programme* (CASP) criteria for qualitative studies were used to assess the quality of the studies included in this thematic synthesis (Critical Appraisal Skills Programme, 2018). The reviewers (C.R.; I.L.) independently assessed the studies, answering questions with "Yes," "No," or "Cannot say." To ensure all relevant data were included in the synthesis, no studies were excluded based on quality assessment. The results are presented in Table 2.

Data Extraction and Synthesis

Two reviewers (C.R. and I.L.) extracted and organized the data from the selected studies into a preformatted table (Table 3) that included the following characteristics: name of

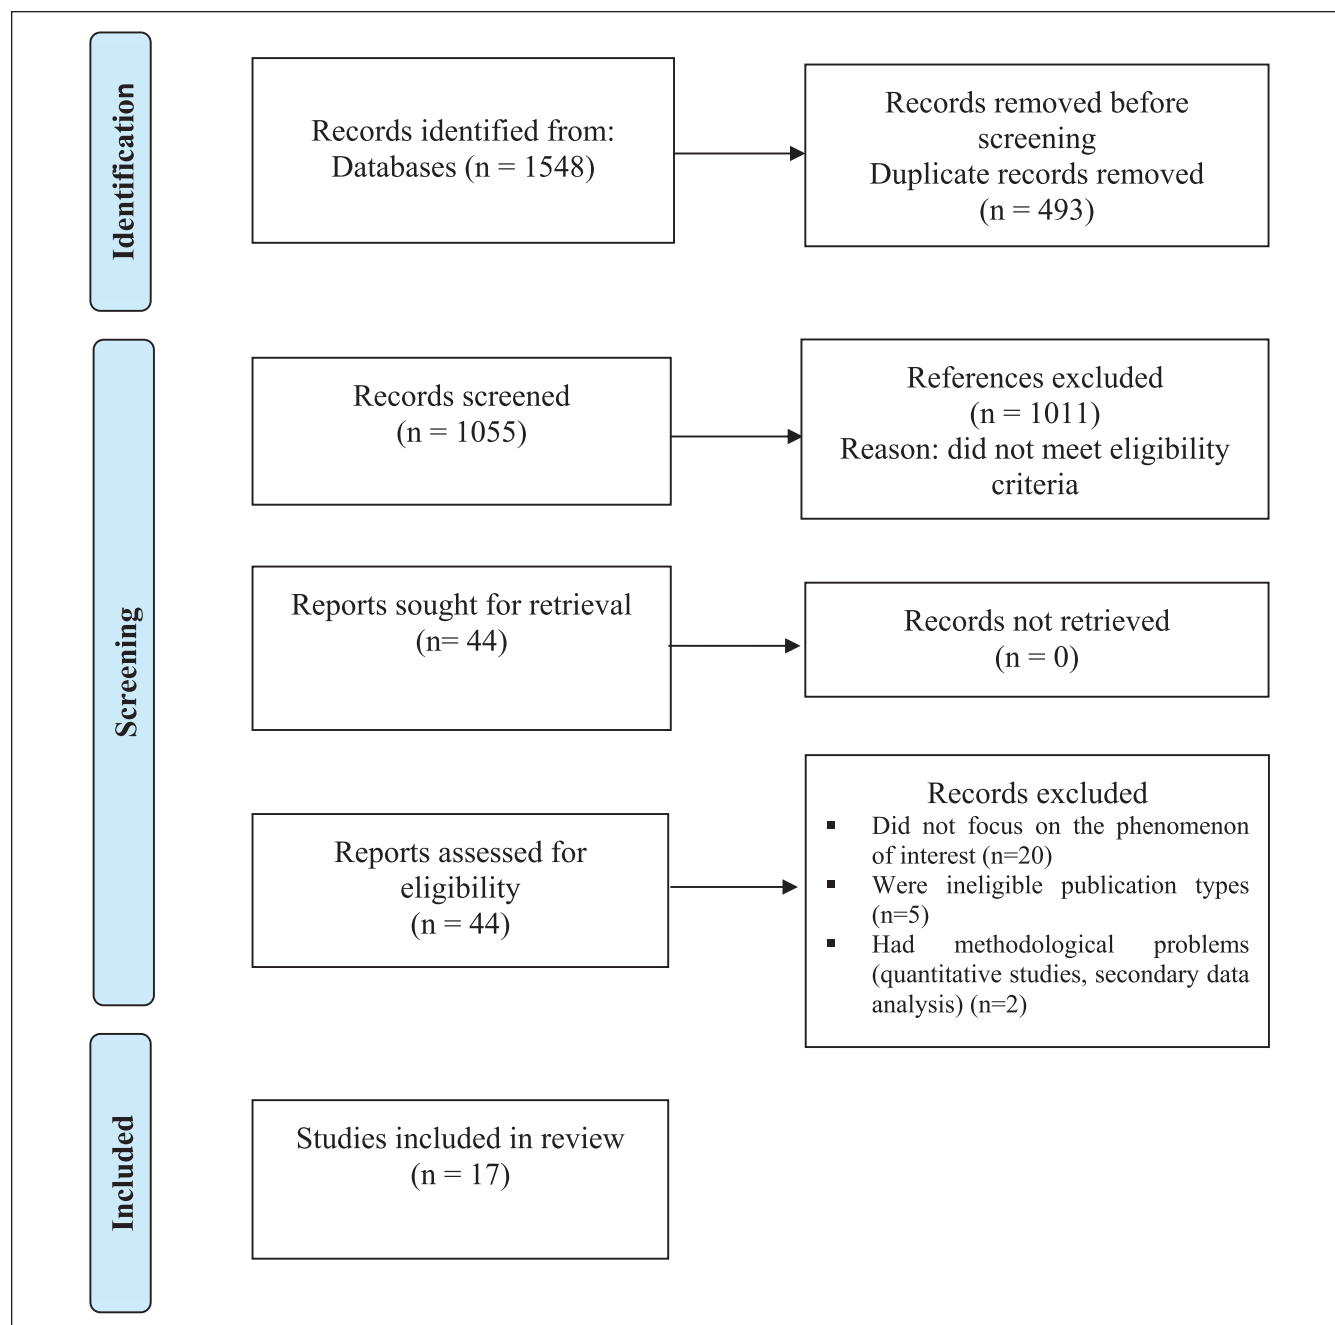

Figure 1. PRISMA Diagram: Study Selection Process (Page et al., 2021).

first author, year and country of publication, aim of the study, study design, sample characteristics, and data collection and analysis methods.

Thematic synthesis, as proposed by Thomas and Harden (2008), was used to analyze the results of the selected studies. Through this approach, themes were identified and developed following a three-step process. For the first two steps, the reviewers coded the text line by line inductively to capture the meaning of each sentence. NVivo20 qualitative data analysis software (QSR International Pty Ltd, 2020) was used to collate the data presented in the “results” or

“findings” sections of the included studies and facilitated coding. The reviewers then assembled the codes by similarities and differences into a tree structure that allowed the development of descriptive themes. Coding and data assembly were carried out by two reviewers (C.R. and I.L.), followed by team discussion (F.D., C.R., I.L., C.G.) to reach agreement on the descriptive themes. Analytical themes were then uncovered and discussed by the team to reach agreement on the thematic structure that best addressed the research questions and went beyond the original content of the selected studies.

¹Was there a clear statement of the research objectives?

²Is a qualitative methodology appropriate?

³Was the research design appropriate for addressing the research objectives?

⁴Was the recruitment strategy appropriate to the aims of the research?

⁵Was the data collected in a way that addressed the research issue?

⁶Has the relationship between researcher and participants been adequately considered?

⁷Have ethical issues been taken into consideration?

⁸Was the data analysis sufficiently rigorous?

⁹Is there a clear statement of findings?

¹⁰How valuable is the research?

Confidence in the Review Findings

The *Confidence in the Evidence from Reviews of Qualitative Research* (GRADE-CERQual) approach was used to assess confidence in the findings (Lewin et al., 2018). Thus, each finding was individually assessed for methodological limitations, consistency, adequacy, and data relevance (C.R.). The overall evaluation for each finding was subsequently ranked. To ensure robustness, a second reviewer (I.L.) validated this assessment.

Reflexivity

Reflexivity is an integral part of quality research and was used throughout this systematic review to ensure the integrity and reliability of the results (Finlay, 2002). To this end, the researchers discussed their own personal and professional experiences with fathers of young children and adolescents to be aware of the subjective and intersubjective elements that might influence their interpretation of the data. Thus, throughout the research process, potential blind spots or biases were examined (Kingdon, 2005).

Results

Study Characteristics

The studies in this thematic synthesis involved 287 nurses ($n = 249$ nurses, $n = 8$ nurse technicians, $n = 8$ nurse managers, $n = 5$ nurse practitioners, $n = 2$ head nurses, $n = 12$ student nurses, $n = 2$ nursing residents, and $n = 1$ clinical nursing instructor) from eight different countries: Sweden ($n = 5$), United States ($n = 3$), Brazil ($n = 2$), Canada ($n = 2$), Iran ($n = 2$), China ($n = 1$), Finland ($n = 1$), and Spain ($n = 1$). The sample represented 224 women, 5 men, and 58 nurses whose gender was not identified in the articles ($n = 6$). The selected studies used a variety of qualitative research approaches, most used interviews as a data collection method. Table 3 presents details of the study characteristics.

The confidence level assessments of the findings using the CERQual approach are presented in Table 4. A total of 23 statements of findings were generated, of which four had a high confidence level, 14 a moderate confidence level, and five a low confidence level.

Table 3. Characteristics of Included Studies ($n = 16$).

Author, year, country	Study aim	Study design	Study sample characteristics	Data collection and analysis methods
(Alehagen et al., 2011) Sweden	To describe nurses' experiences of father participation in CHC (Child Health Care).	Phenomenological study	$n = 9$ nurses; 2 years of experience; expertise in public health or pediatric nursing	Semi-structured interviews; phenomenology according to Giorgi
(Anti et al., 2016) USA	To explore the experience of health care providers in the outpatient setting as they work with fathers of children who are overweight and obese.	Interpretative phenomenological analysis study	Purposeful sampling; $n = 7$ healthcare providers (2 family physicians, 2 pediatric nurse practitioners, 3 family nurse practitioners); all participants are women	Semi-structured interviews; interpretative phenomenological analysis
(Buek et al., 2021) USA	To identify opportunities for education, training, or quality improvement initiatives to improve the perinatal care experience for fathers and families.	Qualitative study	Purposeful sampling; $n = 10$ postpartum nurses in hospitals (9 women and 1 man)	Structured interviews; content and thematic analysis
(Clarkson & Gilmer, 2019) USA	To broaden the knowledge of factors that affect family-centered care of fathers of infants in the NICU from the perspective of nurses.	Exploratory survey study	$n = 94$ nurses; neonatal unit employees (91 women, 1 man and 2 are not mentioned)	Open-ended question; content analysis
(de Montigny et al., 2011) Canada	To explore and describe undergraduate nursing students': (a) perceptions of fathers, including beliefs held about fathers; (b) perceptions of their experience with fathers, including nursing interventions, during their clinical practice; (c) recommendations for further curricula development.	Exploratory descriptive qualitative study	Sequential sampling; $n = 12$ nursing students (10 women and 2 men)	Interviews according to critical incident technique; thematic analysis
(de Montigny, Gervais, Larivière-Bastien, & Dubeau, 2020) Canada	To assess the impacts of the Father-Friendly Initiative within Families (FFIF) program, an interdisciplinary program supporting father involvement, on health professionals' practices with fathers.	Qualitative impact assessment approach	$n = 36$ health professionals (13 nurses, 10 social workers, 6 community workers, 3 educators, 2 psychoeducators, 1 health manager, and 1 special education teacher); 31 of them are women and 5 are men	Semi-structured interviews, thematic analysis
(Dias dos Santos et al., 2013) Brazil	To understand the nursing staff's perception about the man/father's participation in kangaroo care, identify the facilitating and hindering factors of this participation, and describe how inclusion of the man/father in the process is achieved under nursing staff guidance.	Descriptive-exploratory and case study research	$n = 8$ nurses (2 nurses, 6 nurse technicians); have received training on the Kangaroo method	Semi-structured interviews; content analysis
(González-Pascual et al., 2017) Spain	To analyze the relation between nurses and those considered by them as "Muslim fathers," in health institutions within the Community of Madrid (Spain).	Qualitative ethnographic study	$n = 24$ (17 nurses, 7 fathers and mothers); 16 of the nurses are women and 1 is a man	Observation, semi-structured interviews, informal interviews; comparative analysis
(Hammarlund et al., 2015) Sweden	To explore Child Health Center nurses' experiences of observing depression in fathers during the postnatal period, and to explore hindrances in observing these fathers.	Qualitative descriptive study	Purposeful sampling; $n = 10$ nurses; 5 different municipalities in western Sweden; 1 year of child health experience; all participants are women	Interviews; thematic analysis

(continued)

Table 3. (continued)

Author, year, country	Study aim	Study design	Study sample characteristics	Data collection and analysis methods
(Höglund & Holmström, 2008) Sweden	To describe and explore gender aspects in telenursing as experienced by Swedish tele nurses.	Descriptive and explorative qualitative study	Purposeful sampling; $n = 12$ nurses; all participants are women	In-depth interviews twice; thematic analysis
(Kaila-Behm & Vehviläinen-Julkunen, 2000) Finland	To describe the different ways of being a father.	Grounded theory	$n = 24$ fathers and 29 public health nurses; all nurses are women	Interviews (2 or 3) for fathers; essay writing by nurses; comparative analysis
(Mirlashari et al., 2022) Iran	To investigate the circumstance of caring for parents facing infant death in NICUs.	Qualitative descriptive study	$n = 15$ health care providers (6 clinical nurses, 2 head nurses, 1 nursing manager, 4 physicians, 1 neonatal speciality fellowship, and 1 clinical nursing instructors; 13 of them are women and 2 are men) and $n = 11$ family members	In-depth interviews; thematic analysis
(Place & Wells, 2022) Sweden	To gain insight, via nurse-managers' perceptions, into the implementation fidelity of a new clinical visit for fathers at Stockholm County Child Health Centers.	Qualitative study	Purposeful sampling; $n = 7$ nurse managers; all participants are women	Semi-structured interviews; systematic text condensation
(Qin et al., 2024) China	To explore the extent of the breastfeeding information being provided to fathers by health nurses working in hospital.	Qualitative phenomenological study	Objective sampling; $n = 15$ maternal and child health nurses (including 3 International Board Certified Lactation Consultants)	Semi-structured interviews; thematic analysis
(Soares et al., 2019) Brazil	To understand the perceptions of the multiprofessional health care team regarding including fathers in the care of preterm infants in intensive care units (ICUs).	Qualitative descriptive study	$n = 12$ health care professionals (2 nurses, 2 2nd year neonatal nursing residents, 1 neonatologist, 2 2nd year neonatal care medicine residents, 2 nurse technicians, 1 psychologist, 1 social worker, 1 physiotherapist; 11 of them are women and 1 is a man)	Semi-structured interviews; discourse analysis
(Valizadeh et al., 2018) Iran	To understand NICU nurses' lived experiences of family participation in family-centered care.	Interpretative phenomenology of Heidegger study	Purposeful sampling; $n = 11$ nurses from the neonatal care unit	Semi-structured interviews
(Wells et al., 2013) Sweden	To explore Swedish child health nurses' views on their role of involving fathers at Child Health Centres (CHCs).	Qualitative study	$n = 19$ nurses; all participants are women	Interviews; systematic text condensation

Thematic Synthesis Findings

From the thematic synthesis carried out as part of this qualitative systematic review, seven descriptive themes were constructed and apprehended under three analytical themes: (a)

conceiving of the father's role in terms of his involvement within the family; (b) working with fathers based on the nurse's individual conception of the paternal role; and (c) developing a sense of efficacy in working with fathers. These descriptive and analytical themes are illustrated in Table 5.

Table 4. CERQual Summary of Qualitative Findings.

Summary of qualitative findings	Studies contributing to the review finding	CERQual assessment of confidence in the evidence	Explanation of CERQual assessment
Conceiving of the father's role in terms of his involvement within the family			
Believing that the father is an involved and important player			
1. Some nurses consider fathers to be a source of support and security for the mother.	(Alehagen et al., 2011; Buek et al., 2021; de Montigny et al., 2011; Dias dos Santos et al., 2013; Kaila-Behm & Vehviläinen-Julkunen, 2000; Soares et al., 2019)	Moderate confidence	This finding was graded as moderate confidence because of moderate concerns regarding methodological limitations, and minor concerns regarding relevance, coherence, and adequacy.
2. Some nurses believe the father's involvement fosters the child's development.	(Alehagen et al., 2011; Dias dos Santos et al., 2013; Soares et al., 2019; Wells et al., 2013)	Moderate confidence	This finding was graded as moderate confidence because of minor concerns regarding methodological limitations, relevance, coherence, and adequacy.
3. Some nurses consider that the father's involvement benefits all members of the family.	(Buek et al., 2021; de Montigny et al., 2011; Dias dos Santos et al., 2013; Place & Wells, 2022)	Moderate confidence	This finding was graded as moderate confidence because of minor concerns regarding methodological limitations, relevance, coherence, and adequacy.
4. Some nurses think that fathers are present and involved in their child's life and that they have an important role in the care context.	(Alehagen et al., 2011; de Montigny et al., 2011; Place & Wells, 2022; Soares et al., 2019; Wells et al., 2013)	Moderate confidence	This finding was graded as moderate confidence because of minor concerns regarding methodological limitations, relevance, coherence, and adequacy.
Believing that the father is a passive player			
5. Some nurses describe the father as an observer member of the family.	(González-Pascual et al., 2017; Hammarlund et al., 2015; Kaila-Behm & Vehviläinen-Julkunen, 2000)	Low confidence	This finding was graded as low confidence because of minor concerns regarding methodological limitations, and adequacy, and minor concerns regarding relevance, and coherence.
6. Some nurses consider fathers to be passive and not very involved in care.	(Anti et al., 2016; Buek et al., 2021; de Montigny et al., 2011; Dias dos Santos et al., 2013; González-Pascual et al., 2017; Qin et al., 2024; Soares et al., 2019; Valizadeh et al., 2018; Wells et al., 2013)	High confidence	This finding was graded as high confidence because of minor concerns regarding methodological limitations, relevance, and coherence, and very minor concerns regarding adequacy.
7. Some nurses believe fathers are not very receptive to their interventions.	(Anti et al., 2016; González-Pascual et al., 2017)	Moderate confidence	This finding was graded as moderate confidence because of minor concerns regarding methodological limitations, relevance, and coherence, and moderate concerns regarding adequacy.
Working with fathers based on one's conception of the paternal role			
Giving fathers less space			
8. Some nurses choose to pay attention to fathers who show interest.	(Buek et al., 2021; Clarkson & Gilmer, 2019)	Moderate confidence	This finding was graded as moderate confidence because of minor concerns regarding methodological limitations, and coherence, and moderate concerns regarding relevance, and adequacy.
9. Some nurses have preconceived ideas about fathers whose attitudes deviate from what is usually expected of them in a Western context.	(de Montigny et al., 2011; González-Pascual et al., 2017; Kaila-Behm & Vehviläinen-Julkunen, 2000; Mirlashari et al., 2022; Wells et al., 2013)	Moderate confidence	This finding was graded as moderate confidence because of minor concerns regarding methodological limitations, relevance, coherence, and adequacy.

(continued)

Table 4. (continued)

Summary of qualitative findings	Studies contributing to the review finding	CERQual assessment of confidence in the evidence	Explanation of CERQual assessment
10. Some nurses don't feel particularly responsible for involving the father in their interventions, believing that it's more up to him to make the effort.	(Buek et al., 2021; Clarkson & Gilmer, 2019; Wells et al., 2013)	Moderate confidence	This finding was graded as moderate confidence because of minor concerns regarding methodological limitations, relevance, coherence, and adequacy.
11. Some nurses value the mother's role more than the father's.	(Alehagen et al., 2011; Anti et al., 2016; Buek et al., 2021; Clarkson & Gilmer, 2019; Hammarlund et al., 2015; Höglund & Holmström, 2008; Mirlashari et al., 2022; Valizadeh et al., 2018; Wells et al., 2013)	High confidence	This finding was graded as high confidence because of minor concerns regarding methodological limitations, relevance, and coherence, and very minor concerns regarding adequacy.
Adopting inclusive practices that integrate the father in care			
12. Some nurses adapt their practice to facilitate fathers' presence.	(Alehagen et al., 2011; de Montigny, Gervais, Larivière-Bastien, & Dubeau, 2020; Dias dos Santos et al., 2013; Hammarlund et al., 2015; Kaila-Behm & Vehviläinen-Julkunen, 2000; Place & Wells, 2022; Wells et al., 2013)	Moderate confidence	This finding was graded as moderate confidence because of minor concerns regarding methodological limitations, relevance, coherence, and adequacy.
13. Some nurses support the development of the father-child bond.	(Buek et al., 2021; Dias dos Santos et al., 2013; Soares et al., 2019; Valizadeh et al., 2018)	Moderate confidence	This finding was graded as moderate confidence because of minor concerns regarding methodological limitations, relevance, coherence, and adequacy.
14. Some nurses feel a responsibility to involve fathers in their interventions.	(Alehagen et al., 2011; Buek et al., 2021; de Montigny et al., 2011; de Montigny, Gervais, Larivière-Bastien, & Dubeau, 2020; Gong et al., 2019; Hammarlund et al., 2015; Place & Wells, 2022; Qin et al., 2024; Soares et al., 2019; Valizadeh et al., 2018; Wells et al., 2013)	High confidence	This finding was graded as high confidence because of minor concerns regarding methodological limitations, relevance, and coherence, and very minor concerns regarding adequacy.
15. Some nurses pay particular attention to fathers' experience and acknowledge their challenges and emotions.	(Alehagen et al., 2011; Buek et al., 2021; de Montigny, Gervais, Larivière-Bastien, & Dubeau, 2020; Hammarlund et al., 2015; Kaila-Behm & Vehviläinen-Julkunen, 2000; Place & Wells, 2022; Soares et al., 2019)	Moderate confidence	This finding was graded as moderate confidence because of minor concerns regarding methodological limitations, relevance, coherence, and adequacy.
Developing a sense of efficacy in working with fathers			
Communicating with the father is challenging			
16. Some nurses consider that communicating with the mother is easier and more natural.	(Alehagen et al., 2011; Buek et al., 2021; de Montigny et al., 2011; Hammarlund et al., 2015; Höglund & Holmström, 2008; Kaila-Behm & Vehviläinen-Julkunen, 2000; Mirlashari et al., 2022; Place & Wells, 2022; Valizadeh et al., 2018)	High confidence	This finding was graded as high confidence because of minor concerns regarding methodological limitations, relevance, and coherence, and very minor concerns regarding adequacy.
17. Some nurses find that they are limited in their interactions with fathers and know little about them since they rarely attend meetings.	(Anti et al., 2016; Buek et al., 2021; Clarkson & Gilmer, 2019; Hammarlund et al., 2015)	Moderate confidence	This finding was graded as moderate confidence because of minor concerns regarding methodological limitations, relevance, coherence, and adequacy.

Summary of qualitative findings	Studies contributing to the review finding	CERQual assessment of confidence in the evidence	Explanation of CERQual assessment
18. Some nurses are frustrated by the father's passivity.	(Anti et al., 2016; Kaila-Behm & Vehviläinen-Julkunen, 2000)	Low confidence	This finding was graded as low confidence because of moderate concerns regarding methodological limitations, and adequacy, and minor concerns regarding relevance, and coherence.
Needing support for working with fathers			
19. Some nurses need more role models and professional experience to work with fathers.	(de Montigny et al., 2011; Hammarlund et al., 2015; Wells et al., 2013)	Moderate confidence	This finding was graded as moderate confidence because of minor concerns regarding methodological limitations, relevance, coherence, and adequacy.
20. Some nurses receive little training and have few tools for working specifically with fathers.	(Buek et al., 2021; de Montigny et al., 2011; Hammarlund et al., 2015; Mirlashari et al., 2022; Valizadeh et al., 2018)	Moderate confidence	This finding was graded as moderate confidence because of minor concerns regarding methodological limitations, relevance, coherence, and adequacy.
21. Some nurses, with minimal guidance or support for working with fathers, use the same approach with both parents.	(de Montigny et al., 2011)	Low confidence	This finding was graded as low confidence because of minor concerns regarding methodological limitations, and coherence, moderate concerns regarding relevance and substantial concerns regarding adequacy.
Receiving support for working with fathers			
22. Some nurses who have attended reflexive workshops feel more effective and confident in working with fathers.	(de Montigny, Gervais, Larivière-Bastien, & Dubeau, 2020)	Low confidence	This finding was graded as low confidence because of minor concerns regarding methodological limitations, relevance, and coherence, and moderate concerns regarding adequacy.
23. Some nurses who become involved in paternal visits get to know fathers better.	(Place & Wells, 2022)	Low confidence	This finding was graded as low confidence because of minor concerns regarding methodological limitations, relevance, and coherence, and moderate concerns regarding adequacy.

Table 5. Nurses' Experiences of Practicing With Fathers of Children and Adolescents.

Analytical themes	Descriptive themes
Conceiving of the father's role in terms of his involvement within the family	Believing that the father is an involved and important player Believing that the father is a passive player
Working with fathers based on the nurse's individual conception of the paternal role	Giving fathers less space Adopting inclusive practices that integrate the father in care
Developing a sense of efficacy in working with fathers	Communicating with the father is challenging Needing support for working with fathers Receiving support for working with fathers

Analytical Theme 1: Conceiving of the Father's Role in Terms of His Involvement Within the Family

Nurses' conception of the father's role within the family was shaped by the beliefs they held about him. For some, the

father was an involved and important player in the family unit, whereas others saw him more as a passive player.

Believing That the Father Is an Involved and Important Player. Many nurses held the belief that fathers were actively engaged and significant contributors within the family

structure, deeming their involvement advantageous for all family members (Buek et al., 2021; de Montigny et al., 2011; Dias dos Santos et al., 2013; Place & Wells, 2022). According to these nurses, contemporary fathers were viewed as sharing responsibilities for childcare with mothers and actively participating in both caregiving activities and health-related appointments (Alehagen et al., 2011; de Montigny et al., 2011; Place & Wells, 2022; Soares et al., 2019; Wells et al., 2013). Furthermore, this group of nurses perceived fathers as sources of support and security for mothers, playing a crucial role in providing emotional and practical assistance (Alehagen et al., 2011; Buek et al., 2021; de Montigny et al., 2011; Dias dos Santos et al., 2013; Kaila-Behm & Vehviläinen-Julkunen, 2000; Soares et al., 2019). In addition, these nurses acknowledged the significant impact fathers had on a child's development, emphasizing their crucial role in fostering positive growth and well-being (Alehagen et al., 2011; Dias dos Santos et al., 2013; Soares et al., 2019; Wells et al., 2013).

I think . . . that with the pregnant mother, I think dad is a very important piece, the contact with the woman [. . .] the husband accompanies the woman, they feel safer, happier. Everything is a set. Help in the development of the child, I believe so. (Neptune). (Dias dos Santos et al., 2013)

Believing That the Father Is a Passive Player. In contrast, there was a subset of nurses who perceived fathers as passive participants with limited involvement in childcare responsibilities (Anti et al., 2016; Buek et al., 2021; de Montigny et al., 2011; Dias dos Santos et al., 2013; Gong et al., 2019; González-Pascual et al., 2017; Soares et al., 2019; Valizadeh et al., 2018; Wells et al., 2013). According to their perspectives, these fathers were often described as observers who maintained a certain distance from the mother-child dyad (González-Pascual et al., 2017; Hammarlund et al., 2015; Kaila-Behm & Vehviläinen-Julkunen, 2000) and might not have been particularly receptive to nursing interventions (Anti et al., 2016; González-Pascual et al., 2017).

A lot of the moms are traditionally the ones who are usually in charge of preparing meals, so they feel more connected to being able to do something to change [their child's weight]. This same health care professional (HCP) went on to express understanding of fathers for not taking on a more active role related to norms associated with "traditional" roles. (Rebecca) (Anti et al., 2016)

Analytical Theme 2: Working With Fathers Based on the Nurse's Individual Conception of the Paternal Role

Nurses' conception of fathers' involvement differed from one nurse to another and influenced their attitudes toward fathers during their interventions. Thus, nurses who perceived fathers as having a passive role tended not to give them much space; for example, they inquired less about their

needs or involved them less in care. On the other hand, nurses who perceived them as involved and important adopted more father-inclusive practices and were able to involve them more in care.

Giving Fathers Less Space. This descriptive theme revolved around the prevailing tendency among some nurses to undervalue and give less space to fathers in the care of children and adolescents (Alehagen et al., 2011; Anti et al., 2016; Buek et al., 2021; Clarkson & Gilmer, 2019; Hammarlund et al., 2015; Höglund & Holmström, 2008; Mirlashari et al., 2022; Valizadeh et al., 2018; Wells et al., 2013). Despite societal changes in family models, certain nurses continued to prioritize the mother's role, and had specific expectations and preconceived notions of fathers that sometimes led to discriminatory behaviors, as could occur when fathers' attitudes deviated from what was usually expected in a more Western context (de Montigny et al., 2011; González-Pascual et al., 2017; Kaila-Behm & Vehviläinen-Julkunen, 2000; Mirlashari et al., 2022; Wells et al., 2013).

I might spend less time due to talking/questions. In my practice, typically fathers talk less than mothers. They do not always want constant engagement. (Nurse participant) (Clarkson & Gilmer, 2019)

They sit down, they don't get up, the woman gets up, burdened, in pain, to change the child, to change him and he, the typical Arab, doesn't move. (E1-P, Nurse) (González-Pascual et al., 2017)

Other nurses felt no particular responsibility for involving fathers in their interventions. Rather, they considered that it was up to the father to get involved, and they paid more attention to those who showed interest (Buek et al., 2021; Clarkson & Gilmer, 2019; Wells et al., 2013).

Just depends on the person. If the father is willing to talk, interact, learn, and be cooperative, I am more likely to spend time working with him. (Clarkson & Gilmer, 2019)

Adopting Inclusive Practices That Integrate the Father in Care. Nurses who strived to integrate fathers into care adopted inclusive attitudes that reflected the value they ascribed to the father's role (Alehagen et al., 2011; Buek et al., 2021; Place & Wells, 2022; Wells et al., 2013). They paid close attention to fathers' experience and acknowledged their unique challenges and emotions (Alehagen et al., 2011; Buek et al., 2021; de Montigny, Gervais, Larivière-Bastien, & Dubeau, 2020; Hammarlund et al., 2015; Kaila-Behm & Vehviläinen-Julkunen, 2000; Place & Wells, 2022; Soares et al., 2019).

That's the most important work we have, to see and ask questions about what it like really is. It affects the child if the family is not feeling well. So it's really important to involve the fathers—they

belong to the family and the child. (Participant 7) (Hammarlund et al., 2015)

These nurses felt a responsibility to involve the father during their interventions, considered the father's presence and involvement to be essential when performing a comprehensive family assessment (Alehagen et al., 2011; Buek et al., 2021; de Montigny et al., 2011; de Montigny, Gervais, Larivière-Bastien, & Dubeau, 2020; Gong et al., 2019; Hammarlund et al., 2015; Place & Wells, 2022; Soares et al., 2019; Valizadeh et al., 2018; Wells et al., 2013), and supported the development of the father-child bond (Buek et al., 2021; Dias dos Santos et al., 2013; Soares et al., 2019; Valizadeh et al., 2018). They also strived to adapt their professional practice and service provision to support fathers' presence while encouraging them to be more active in child-care (Alehagen et al., 2011; de Montigny, Gervais, Larivière-Bastien, & Dubeau, 2020; Dias dos Santos et al., 2013; Hammarlund et al., 2015; Kaila-Behm & Vehviläinen-Julkunen, 2000; Place & Wells, 2022; Wells et al., 2013).

... [During the home visit] if the father goes to the kitchen, you can say "I'll wait to continue until you come back." So we [nurse and mother] just talk about something that maybe isn't so important for both of them. (Place & Wells, 2022)

Analytical Theme 3: Developing a Sense of Efficacy in Working With Fathers

The development of a sense of efficacy in nurses working with fathers was characterized by certain communication challenges, as well as by needing and receiving support in their professional practice.

Communicating With the Father Is Challenging. When it came to communicating with fathers, access was the first challenge nurses faced (Buek et al., 2021; Clarkson & Gilmer, 2019). Nurses reported being limited in their interactions with fathers and not knowing them well, as fathers seldom attended the various meetings involving health care (Anti et al., 2016; Hammarlund et al., 2015). Moreover, nurses sometimes felt they got to know the fathers primarily through the mothers' stories (Anti et al., 2016; Hammarlund et al., 2015).

I can't remember the last time I had a discussion with a dad about weight and exercise because it's been with moms. I can probably count on one hand the number of times I've ever had a dad involved in that kind of discussion, just because they're not there for the visit. I have been a nurse practitioner since 1998, and in several states, and it hasn't been any different in any of them. (Della) (Anti et al., 2016)

Then, many nurses found it easier and more natural to communicate with the mother (Buek et al., 2021; de Montigny

et al., 2011; Hammarlund et al., 2015; Höglund & Holmström, 2008; Mirlashari et al., 2022; Valizadeh et al., 2018) and found some fathers' passivity toward care frustrating (Anti et al., 2016; Kaila-Behm & Vehviläinen-Julkunen, 2000).

Of course, it's easier to talk to a woman, we have more in common . . . it's generally easier to understand, we have the same view on things so to speak. // It's generally speaking easier to understand, because we share a common . . . You often get more emotions from female callers . . . // To a mum I might say "yes it's hard to watch them [children] feeling bad with a high fever and everything, of course it is, but when it's a virus infection there's nothing to do about it, it takes its time but they'll be well soon." They need caring. But to a dad you don't say such a thing in that tone of voice. (Nurse 1) (Höglund & Holmström, 2008)

They also added that the difficulty in establishing a connection might have stemmed from the fact that fathers were more assertive and demanding about care (de Montigny et al., 2011; Höglund & Holmström, 2008; Kaila-Behm & Vehviläinen-Julkunen, 2000). However, in some cases, fathers' enthusiastic attitude facilitated the development of a good relationship with nurses, some of whom even considered it easier to interact with fathers than with mothers (Alehagen et al., 2011; Place & Wells, 2022).

Needing Support for Working With Fathers. Nurses reported a need for professional role models when working with fathers, especially if they were inexperienced, as they did not always know how to intervene (de Montigny et al., 2011; Hammarlund et al., 2015; Wells et al., 2013). In such situations, nurses became uncomfortable and dissatisfied with their practice (Hammarlund et al., 2015). Many nurses reported having received little specific training related to working with fathers, and the tools available to them to interact with families were primarily developed for mothers (Buek et al., 2021; de Montigny et al., 2011; Hammarlund et al., 2015; Mirlashari et al., 2022; Valizadeh et al., 2018). In the absence of specific guidelines and support for working with fathers, nurses used the same approach for both parents (de Montigny et al., 2011).

[. . .] we were told it is important to involve fathers, but we were not shown how to . . . if there were specific things we had to check with fathers, it would be easier. (Lara) (de Montigny et al., 2011)

We don't have a method for how to deal with fathers who feel bad. Today we're doing nothing, and it doesn't feel good. We need a methodology that involves fathers. (Participant 10) (Hammarlund et al., 2015)

Receiving Support for Working With Fathers. Nurses who had been introduced to various father-inclusive practices had learned to better understand the specific attributes of this

clientele and had been able to gain more skill in working with them (de Montigny, Gervais, Larivière-Bastien, & Dubeau, 2020; Place & Wells, 2022). Attending various training programs helped nurses feel more effective and confident in their work with fathers (de Montigny, Gervais, Larivière-Bastien, & Dubeau, 2020; Place & Wells, 2022).

Well, I ask if they have questions, but obviously they never do. But I always have some for them, and I try a lot to make jokes. Humour . . . then I talk about hockey, and I tell them I'm going to check my cell phone to see the score. (Nurse clinician) (de Montigny, Gervais, Larivière-Bastien, & Dubeau, 2020)

I think that now that I have another method, another way and other questions, and that is maybe why I have found them [now]. I have had many fathers who, now they have several children, I've now learnt that the first time, they didn't feel good, but I didn't see it at the time. (Nurse-manager 3) (Place & Wells, 2022)

Discussion

The purpose of this review was to systematically synthesize the qualitative evidence on nurses' experience of interacting with fathers when providing care to their children and adolescents in various contexts. Three analytical themes were identified: (a) conceiving of the father's role in terms of his involvement within the family, with the subthemes believing the father is an involved and important player and believing the father is a passive player; (b) working with fathers based on the nurse's conception of the paternal role, with the subthemes giving fathers less space and adopting inclusive practices that integrate the father in care; and (c) developing a sense of efficacy in working with fathers, with the subthemes finding it challenging to communicate with the father, needing support for working with fathers, and receiving support for working with fathers. These results are discussed below under three key headings: (a) working with fathers, a way to promote diversity, equity, and inclusion in the health care; (b) nurses' knowledge about men and fathers; and (c) culture and beliefs at the heart of nurses' practice with fathers.

Key Point 1: Working With Fathers, a Way to Promote Diversity, Equity, and Inclusion in the Health Care

Changes in the family structure, particularly related to who are considered members of the family, have created many challenges. Recently, the conceptualization of the father's role has taken on a new aspect with the growing worldwide movement promoting diversity, equity, and inclusion. Not only do nurses need to consider diversity in the family structure and functioning, but they also have to consider gender-based health disparities (Selwyn & Thomas, 2023) and promote health equity (Gray et al., 2023). In this study, nurses tended to maintain a traditional conception of the

father's role, often approaching the father as a passive player. By doing so, they tend to focus their attention and their care on the mother and the child, compromising father's access, fair treatment in care and development opportunities. As a member of the systems that have an impact on the health of the fathers but also on family system, nurses should contribute to families' capacity to fulfill their social functions (e.g., economic support; education; health and mental health; protection of vulnerable family members; affection and caring; Feetham, 2018), which they can do by promoting and supporting father involvement. This should be done with careful consideration and respect as family dynamics and gender roles are influenced by cultural and ethnical origins of both parents. Promoting and supporting father involvement, in a way coherent with the increasing diversity in family structure, functioning, and parental roles, is a powerful strategy to reach a more egalitarian distribution of family responsibilities and reduce gender-based inequalities (Secrétariat à la condition féminine, 2022). It could also contribute to disrupt the pathway between social marginalization, early life stress, and negative health outcomes for children (Taha et al., 2024) as father involvement is a protective factor against poverty during infancy (Allen & Daly, 2007). Including fathers in care includes proactively and directly asking them about how they would like to be included in the care of their child. Developing abilities to better work with men and fathers is the responsibility of the nurses and health care providers to infuse equity and address health disparities, and for this, knowledge about men and masculinities is essential, as well as about sex and gender discrimination in the health services (Selwyn & Thomas, 2023).

Key Point 2: Nurses' Knowledge About Men and Fathers

The results showed that nurses included fathers when they perceived them as interested in being involved. In those cases, they appeared to be at ease with carrying out educational interventions perceived as suitable and useful for meeting fathers' learning needs in relation to their child's care. Conversely, when fathers did not spontaneously express a desire to learn or be involved, nurses felt uneasy and appeared not to know how to interact with them. They were unable to explore the fathers' vision of their role or to encourage them to become more involved. A meta-ethnographic study showed that fathers' caregiving experiences in medical settings continue to be shaped by health professionals' conceptions of masculinity and fatherhood (Postavaru et al., 2021). Fathers have reported not feeling listened to or valued. They are often solely considered as a support to the mother, while their own support needs remain unaddressed. They expect nurses to be more proactive in addressing their needs for support, such as asking them how they feel about their role as father (Hrybanova et al., 2019; Postavaru et al., 2021). The findings of the present study raise questions

regarding nurses' knowledge about fathers' involvement and masculinity issues. Generally, the nurses seemed unaware of the variety of ways in which men can express their masculinity. For example, to cope with challenging situations, fathers who adhere to traditional masculinity norms may adopt evasive strategies such as alcohol abuse, longer working hours, and hiding their emotions (Polita et al., 2023). In such cases, nurses could misinterpret fathers' behavior and be less sensitive to how these men might express their needs or suffering. This translates into a kind of inadequacy, with nurses not knowing how to react when fathers take a different stance than what they expect. Most of the nurses in this study were women, which may also have had an impact on their interventions with fathers. Female nurses may find it easier to communicate with mothers and family members of the same gender (Buek et al., 2021), which could be considered an unconscious bias. Furthermore, fathers might be more open to expressing needs and concerns to male nurses, given that in traditional masculinity they cannot show weakness to women or within the family.

A cross-sectional study of nurses' attitudes regarding the importance of families in nursing care showed that they do consider families to be important. However, being a younger nurse with a basic education, minimal hospital experience, and no personal experience of family illness were predictors of less supportive attitudes toward family inclusion in nursing care (Østergaard et al., 2020). Within the family-centered care approach—as recommended internationally by World Health Organization (WHO)—the fathers' voice and involvement in family care and health are as important as the mothers. Therefore, nurses' beliefs play an essential role in determining whether they think it is important to involve fathers or whether they consciously or unconsciously decide they do not have time to involve the fathers.

Key Point 3: Culture and Beliefs at the Heart of Nurses' Practice With Fathers

Parenting roles, especially the role of father, are strongly influenced by culture, and nurses' cultural background may influence their beliefs about fathers. As immigration increases, nurses are encountering a greater diversity of beliefs and behaviors related to the paternal role. Combined with their own beliefs, both about the importance of paternal involvement and about the family structure and functioning of certain ethnocultural groups, this diversity can cause uneasiness among nurses. Unable to decipher the expectations and needs of fathers from other ethnocultural groups than their own, nurses may prefer to stand back rather than risk making seemingly embarrassing comments or interactions faux pas. Beliefs regarding the importance of fathers' role in the family can also impact nurses' adoption of father inclusive practices, such as making space for fathers and recognizing and addressing their needs.

Relevance for Family Nursing Practice

The results of this study inspire recommendations to improve family nursing education to strengthen clinical practices. These results underscore the need to better define family nurses' role in supporting fathers' involvement in various care and cultural contexts across the life course. When nurses are taught about the specifics of masculinity issues and the benefits of fathers' involvement for all family members, their unconscious biases and preconceptions regarding men and parenting roles surface more overtly. With this newfound awareness, they are better equipped to overcome biases and hesitance to interact with fathers. Nurses trained in implementing father inclusive practices have a stronger sense of efficacy and are more able to invite fathers to participate in care, to identify their needs, and to support them in their parenting role (Dubeau et al., 2023).

When developing this type of training, it is useful to actively involve fathers in co-creating interventions that address their needs. Partnering with them in the design of curriculum and innovative programs can increase awareness among students and nurses. Different teaching strategies, such as simulations, can help nurses develop competencies in exploring fathers' role, expectations, and needs.

While nurses can, as individuals, implement father inclusive practices in their family-centered care approach, as recommended by the WHO (2015), the health organizations in which they work also need to be inclusive of paternal realities. Openness, knowledge, and institutional support are three documented elements that support the advancement of father inclusive practices (Dubeau et al., 2023). For example, it is known that when health organizations value father inclusion, this positively influences nurses' practices. As such, nurses and health care managers need to work together to foster father friendly health care environments. Developing father inclusive communities of practice can provide a valuable tool for implementing change on a broader scale.

Limitations

This study has some limitations. One is the limited quality level of certain themes due to the fact that some themes were only informed by one article. However, these themes were important in providing a comprehensive perspective and could not be ignored. A second limitation is that the majority of studies surveyed were carried out with female nurses. Thus, the results might not adequately reflect male nurses' attitudes and beliefs regarding fathers of children and adolescents, nor the male perspective regarding their sense of efficacy in collaborating with fathers.

Conclusion

Globally, there is a movement to promote diversity, equity, and inclusivity. Nurses are on the forefront of embracing the

family unit as a whole and directly addressing each family member's role to identify and involve the significant players in the child's health care. As such, nurses are in a privileged position to promote fathers' status as being on equal footing with mothers within a family-centered care approach and to act as ambassadors for fathers, mothers, and co-parents.

Acknowledgments

The authors wish to acknowledge Mrs Donna Riley, editor and translator, for her assistance in translating the manuscript into English.

Author Contributions

DE MONTIGNY was responsible for conceptualization, formal analysis, funding acquisition, project management, supervision, validation, visualization, and writing of the original draft and review & editing.

RENÉ and LANDRY were responsible for data curation and contributed to formal analysis, investigation, project management, validation, visualization, and writing of the original draft and review & editing.

Brødsgaard, POLITA, DANFORD, SHEPPARD-LEMOINE, IKEDA, NASCIMENTO, SOMANADHAN, and ALVARENGA contributed to validation and writing (review & editing).

GERVAIS was co-responsible for conceptualization, funding acquisition, supervision and contributed to validation and writing of the original draft and review & editing.

Data Availability

The data used in this qualitative systematic review are derived from primary articles cited in the manuscript. Full references for these studies are available in the References section, and interested readers can access the original data by consulting these sources.

Declaration of Conflicting Interests

The authors declared no potential conflicts of interest with respect to the research, authorship, and/or publication of this article.

Funding

The authors disclosed receipt of the following financial support for the research, authorship, and/or publication of this article: This work was funded by the Fonds de recherche du Québec—Société et culture, through funding attributed to the Paternity, Family and Society Research Group as well as a grant from the Pole of expertise and research on men's health and well-being.

Ethical Considerations

The research presented in this manuscript was approved on December 23rd 2020 by the Université du Québec en Outaouais Research Ethics Committee (protocol number 2021-1516) and has ongoing ethic certification.

Author Biographies

Francine de Montigny, OQ, RN, PhD, FCAN, is a full professor at the Université du Québec en Outaouais, director of the Interdisciplinary Research Group on Fatherhood, the Family, and Society, made up of more than 30 specialists in Canada and abroad. Her areas of research are parental mental health surrounding the birth and the death of an infant and father inclusive practices. She has developed and implemented training both in Canada and abroad. Fellow of the Canadian Nursing Academy (2022), she received the highest distinctions of the Québec Province for her dedication to families (National Order of Québec, 2017 and Scientific Award, 2018). Her publications are included in *Canadian Journal of Nursing Research*, *Psychology of Men & Masculinities*, *Frontiers in Psychiatry*, and *Journal of Clinical Nursing*.

Caroline René, RN, PhD, is a professor in the Nursing Faculty at the Université du Québec en Outaouais and member of the Fatherhood, the Family and Society research group. Her areas of interest focus on

family health, particularly reproductive challenges such as infertility, assisted reproduction, and perinatal loss. Her recent relevant publications are in *Journal of Family Nursing*, *Nursing Open*, and *International Journal of Nursing Studies Advances*.

Isabelle Landry, RN., MSc, is a professor in the Department of Nursing Sciences at the Université du Québec à Trois-Rivières and a PhD candidate in nursing sciences at the Université du Québec en Outaouais. She is also a member of the Fatherhood, the Family and Society research group. She teaches nursing practice in perinatal care and quality of care management. Her research focuses on the relational experience of nurses with couples during childbirth. Her recent relevant publications are in *Nursing Open* and *International Journal of Nursing Studies Advances*.

Anne Brødsgaard, RN, PhD, MPH, Health Visitor, is a professor at Roskilde University, Department for People and Technology, an external lector at Aarhus University, Nursing Research and Care, and a senior researcher at the Department of Paediatrics and Adolescent Medicine & Gynecology-Obstetrics at Copenhagen university hospital, the Capital Region of Denmark. She is the director of the Child, Maternal, and Family Health Research Group with a national complex intervention program focusing on a more father-inclusive culture in a family-centered context in the neonatal (intensive) care units and across health care sectors. She oversees several PhD students and postdoctoral researchers and has secured research grants for infant and family health projects. Her recent relevant publications are in *Journal of Pediatric Nursing*, *Journal of Perinatal Neonatal Nursing*, and *Journal of Obstetrics, Gynecology & Neonatal Nursing*.

Naiaa Barros Polita, RN, PhD, is an adjunct professor at the State University of Londrina, Brazil. She is a member of the Nursing Research Group on Child and Adolescent Care (GPECCA) and the Study and Research Group on Assessment, Technology and Innovation in Health (GEPATIS). She is also a collaborator of the Fatherhood, Family and Society Team. Her research focuses on family experience with pediatric chronic conditions. She is interested in examining fathers' experience and developing strategies to promote fathers' involvement in the child's life. Her recent relevant publications are found in *Revista Brasileira de Enfermagem*, *Journal of Child Health Care*, and *Journal of Pediatric Oncology Nursing*.

Cynthia A. Danford, PhD, CRNP, PPCNP-BC, CPNP-PC, FAAN, is nurse scientist II in the Office of Nursing Research and Innovation and consultative staff in the Lerner Research Institute at Cleveland Clinic, Cleveland, Ohio. She is also a pediatric nurse practitioner with extensive experience in pediatric primary care and family nursing. Her program of research focuses on family-centered approaches to minimize obesity and cardiovascular risk and specifically involves helping families with young children instill healthy habits related to eating, physical activity, and sleep. Her innovative research with event history calendars has been funded by the National Institute of Child Health and Development (NICHD) National Institute of Health (NIH). Relevant publications include "Building Family Interventions for Scalability and Impact" in *Journal of Family Nursing* (2024, with K. Mooney-Doyle et al.), "Fathers' ongoing journey when a child in the family has a chronic

condition: A meta-synthesis in *Journal of Family Nursing* (2024, with K. Roberts et al.), and "What Obese and Healthy Weight Preschoolers Believe and Know About Food" in *Cognitive Development* (2021, with C. M. Schultz).

Debbie Sheppard-LeMoine, RN, PhD, is a full professor and the Dean of Faculty of Nursing at the University of Windsor since 2020. With more than 30 years of experience as an educator including 15 years of international teaching, research, and project experience, her program of research includes successfully leading an international research team on interprofessional learning within a simulated, family assessment environment. She has completed a study on enhanced home visiting practices that surround women and children who live within vulnerability. She has also focused on implementation science research examining collaborative, interprofessional practices that foster community and citizen access to health services and optimal scope of RN practice in emergency services. Her recent publications can be found in *Journal of Excellence in College Teaching and Nursing Reports*.

Mari Ikeda, RN, PhD, PHN, CCP, is a full professor in family nursing at The University of Tokyo. She holds a master's in clinical psychology from Tsukuba University and a PhD in health sciences from UTokyo. A leader in maternal mental health, she's renowned for her research on postpartum mood disorders, focusing on the broader family-level effects, including fathers. She has developed a program addressing postpartum mood among new parents using both qualitative and quantitative research methods. She has also created group therapy interventions for cancer patients and their families. Her work has been published in esteemed journals such as *Attachment and Human Development*, *Sexual & Reproductive Healthcare*, *Cancer Reports*, *Practice in Pediatric Psychology*, and *Journal of Family Nursing*.

Lucila Castanheira Nascimento, RN, PhD, is a full professor at the University of São Paulo at Ribeirão Preto College of Nursing, SP, Brazil, WHO/PAHO Collaborating Centre for Nursing Research Development, Director of the Nursing Research Group in Child and Adolescent Care and their Families and a member of the Interdisciplinary Research Group on Fatherhood, the Family, and Society. Her current program of research focuses on the experiences of children and adolescents with chronic conditions and their families. Her recent relevant publications are in *Journal of Pediatric Nursing-Nursing Care of Children & Families*, *Journal of Family Nursing* and *Cancer Nursing*.

Suja Somanadhan, PhD, RCN, RGN, RNT, is an associate professor and associate dean for global engagement at the UCD School of Nursing, Midwifery & Health Systems, University College Dublin, Ireland. A Fulbright Health Impact Scholar, her research is driven by a commitment to advancing health and well-being while fostering equity and inclusive care for children, young people, and their families. Her work focuses on rare diseases, including both genetic and nongenetic disorders, aiming to understand and address health care disparities to promote holistic and patient-centered care. She leads multiple research projects on child and family health, particularly in the context of rare diseases. She supervises several PhD students and postdoctoral researchers and has secured competitive research grants. Her work is widely published in high-impact

journals, including the *British Journal of Music Therapy*, *Journal of Pediatric Nursing*, and *Healthcare*.

Willyane de Andrade Alvarenga, RN, PhD, is a professor in the postgraduate program in public policies at the Federal University of Piauí and an associate professor at the Centro Universitário Santo Agostinho, Teresina, Brazil. She is a member of the Nursing Research Group on Child and Adolescent Care (GPECCA) and the Fatherhood, Family and Society Team. Her current program of research focuses on the psycho-socio-spiritual health of families and children with chronic health conditions, including the fathers' involvement in the child's life. Her recent relevant publications can be found in *Journal of Pediatric Nursing*, *Revista Brasileira de Enfermagem*, and *Seminars in Oncology Nursing*.

Christine Gervais, RN, PhD, is a full professor at the Université du Québec en Outaouais. Co-director of the research laboratory Tout un village, she is also director of the university institute SHERPA, as well as a member of the research partnership Familles en mouvance and the Interdisciplinary Research Group on Fatherhood, the Family, and Society. Her research focuses on family health. She is particularly interested in the experience of children and adolescents in situations that concern them, as well as in immigration issues. She also has extensive expertise in the development and evaluation of programs and interventions designed to promote or support family health. Her publications are included in *Canadian Journal of Nursing Research*, *Child and Family Social Work*, *Child Indicators Research*, and *Family Process*.
